Application protocol:

Feature List:

the application allow client to decide whether it want to upload or download file from server.

Build instruction:

I create the makefile.

execute **"make"** command to build the project.

Test instruction:
- server application:
   - $ ./srcp_srv
- client application:
    - $./srcp_clnt [source file path] [destination file path]
    - note:client application will depend on the file path argument you provide to decide whether user want to upload file or download file. Example:
        - **download from server : $./srcp_clnt 192.168.0.0:filePath.txt filePath.txt**
        - **upload to server: $./srcp_clnt filePath.txt 192.168.0.0:filePath.txt**

Test Log:

Download from server

upload to server and execute cmp command to compare two file
